**Install VirtualBox Software on a macOS**

Step 1. Double click the installation file to initiate. (File name is VirtualBox-version-OSX.dmg) Most likely, you will see the following pop-up window. Click "OK". This occurs because Apple cannot guarantee the security of the package. Let's change some security preferences so that we can eventually install the package.

Step 2. Click the Apple icon on top-left, the click "System Preferences", then "Security & Privacy".

Step 3. Under "General" tab, click the "lock" image to unlock the current security settings (you will be prompted to enter your account password). Lastly, click "Open Anyway" to allow VirtualBox to be installed to the system.

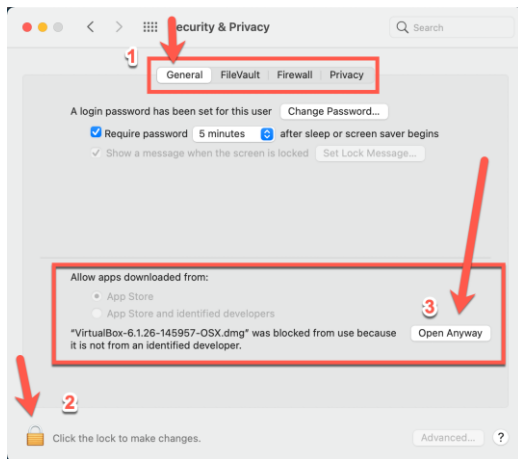

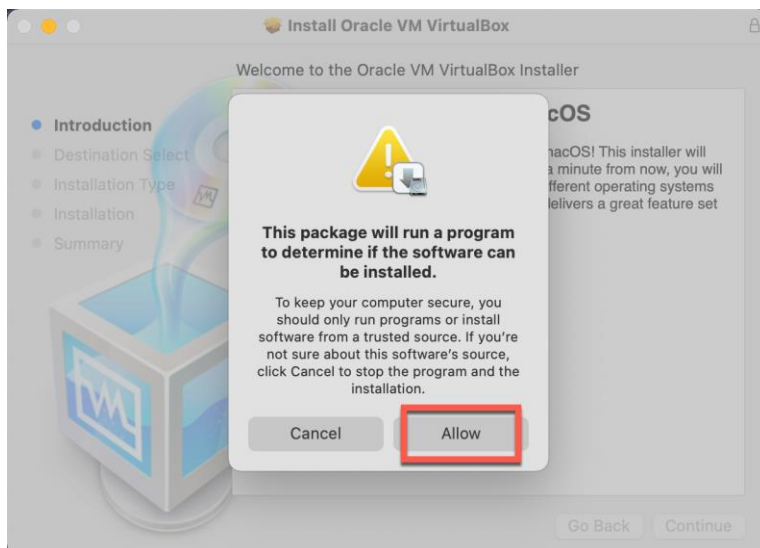

Step 4. It asks again. "Open".

Step 5. The following screen will show up. Double click the icon (VirtualBox.pkg). A familiar dialog box will pop-up. Please repeated step 2 to 4. (Note: the previous step authorized the installation package enclosure program, the current step authorizes the actual installation program.)
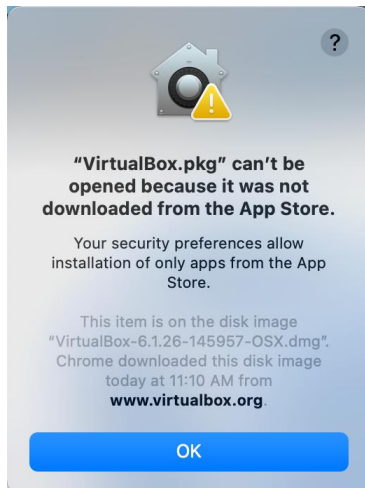

Step 6. Eventually, this screen will show up. Please "Allow" it.

Step 7. Click "Continue" to proceed. Then, click "Install". You will be prompted with an account password window.

Step 8. Installation successful message will show up.
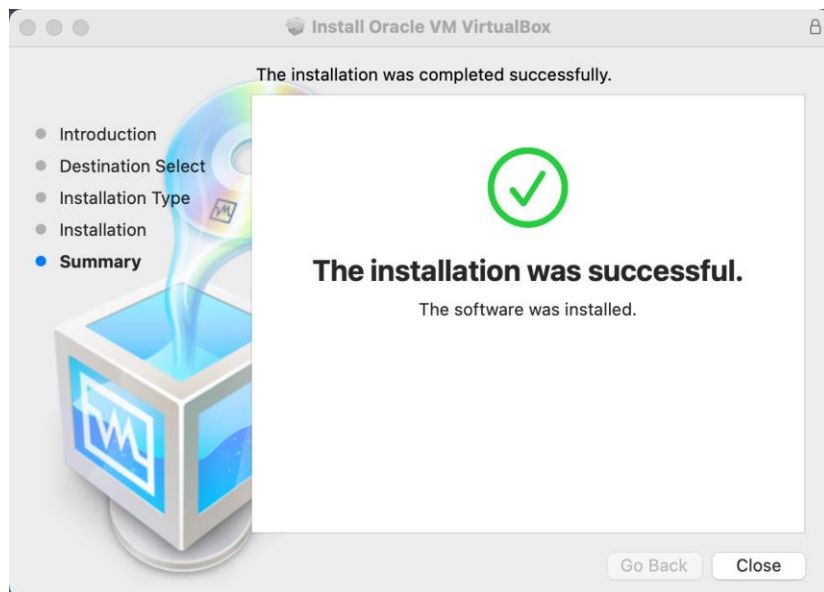

Step 9. Open your VirtualBox app from the list of applications. It opens in the following screen. If there are any other prompts show up, in general, please grant permission it requests. If you are not clear, please ask me.

Oracle VM VirtualBox Manager

Tools

| Preferences | Import | Export | New | Add |

Welcome to VirtualBox!

The left part of application window contains global tools and lists all virtual machines and virtual machine groups on your computer. You can import, add and create new VMs using corresponding toolbar buttons. You can popup a tools of currently selected element using corresponding element button.

You can press the ⌘? key to get instant help, or visit www.virtualbox.org for more information and latest news.
